Immunogenic polypeptides useful for preventing the harmful effects of immunoglobulin \boldsymbol{E} in mammals.

The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the human. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema. (Updated on 12-SEP-2003 to standardise OS field)

host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Mucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
The present invention relates to a composition comprising a polypeptide and an aluminium compound, where the polypeptide comprises a self-IgB polypeptide sequence (e.g. an ORO polypeptide or an OSO polypeptide:
ADN00643, ADN00646, ADN00650, ADN00652, ADN00654, ADN00656, ADN00658 or ADN00661. Administration of the composition to anamumal reduces the level of detectable free IgB in the mammal. The composition is useful for inducing an anti self-IgB antibody response in a mammal for treating or preventing allergies. The present sequence is an OSO procean, used to illustrate the invention. The OSO protein contains an opossum CH2 IgB domain followed by a human CH3 IgB domain followed by an opossum CH4 IgB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        302

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Opossum; immunoglobulin E; IgE; vaccination; infection; allergy; asthma; eczema; immunogenic peptide.
                                                                                                                                           The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the dog. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EFHHHHHHTLSLPESGPVTIIPPTVKLFHSSCDPRGDAHSTIQLLCLVSGFSPAKVHVTW
                                Immunogenic polypeptides useful for preventing the harmful effects of immunoglobulin E in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 BFHHHHHHTLSLPESGPVTIIPPTVKLFHSSCDPRGDAHSTIQLLCLVSGFSPAKVHVTW

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           MLPPSPEETGTTRTVTCLIRGEYPSEISVQWLFNNEEDHTGHHTTTRPQKDHGTDPSFFL 299
                                                                                                                                                                                                                                                                                      The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the rat. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                  Immunogenic polypeptides useful for preventing the harmful effects of immunoglobulin E in mammals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           299
                                                                                                                                                                                    The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2, 3 and 4 of the opossum IgE. It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

The present invention relates to a composition comprising a polypeptide and an aluminium compound, where the polypeptide comprises a self-IgE polypeptide sequence (e.g. a.m. ORO polypeptide or an OSO polypeptide. ADN06643, ADN06646, ADN06650, ADN06650 or level of the composition of the composition to a mammal reduces the level of detectable free IgE in the mammal. The composition is useful for inducing an anti self-IgE antibody response in a mammal for treating or preventing allergies. The present sequence is an ORO protein, used to illustrate the invention. The ORO protein, used to domain followed by a rat CH3 IgE domain followed by an opossum CH4 IgE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GVSAYLSRPSPFDLFIRKSPTITCLVVDLAPSKGTVNLTWSRASGKPVNHSTRKEEKQRN 188

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the protein sequence of an opossum CH2-rat CH3-opossum CH4 (ORO) chimeric IgE polypeptide. A vector comprising a nucleic acid encoding ORO can be used for recombinant production of this chimeric IgE in host, e.g. CHO, cells. The invention provides methods and materials related to expressing chimeric IgE proteins. Nucleic acid vectors, host cells, and methods for producing chimeric IgE polypeptides are provided. When administered to a mammal, the chimeric polypeptides can reduce the IgE antibody effects of IgE-related diseases such as asthma, allergies and eczema.

It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur. pollen and food allergies and eczema.                                                                                                                              Immunogenic peptide consisting of opossum CH2, mouse CH3 and opossum CH4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                  Mouse, opossum; immunoglobulin E; IgE; vaccination; infection; allergy; asthma; eczema; immunogenic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2 and 4 of the opossum IgE and the heavy chain constant region 3 from the mouse. It was shown to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against becterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (RepsilonR). Also provided are nucleotide sequences encoding such a fusion protein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated hypersensitivity reaction, such as asthma, allergic rhinitis, a topic dermatitis, severe food allergies, chronic urticaria, angioedema or anaphylactic shock, or autolimune diseases such as rheumatoid architis, type-I diabetes mellitus, or multiple sclerosis, and for preventing of,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New fusion molecules comprising polypeptide sequences that bind to IgG inhibitory receptor and native IgE receptor, useful for treating IgE-mediated hypersensitivity reactions, e.g. asthma or allergies, or autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                     This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell pricope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in an B. Coli system, this sequence was used to create the epitopes of the invention
                                                                                                                                                                                                                                                                                                                                                                     123
                                                                                                                                                                                                                                                                                                                                                                                               201

This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from igE, and T helper cell epitope (TH epitope) which is foreign to the animal. by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human system, this sequence was used to create the epitopes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          259

This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IGE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IGE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen the surface (TH epitope) which is foreign to the animal, by antigen the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IGE in the animal, which is useful for downregulating autologous IGE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IGE heavy chain C2-C3-C4 domains used to create the epitopes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Inducing immune response against autologous immunoglobulin B in an animal, by effecting simultaneous presentation of cytotoxic T lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.

```
The amino acid sequence of the Fc(epsilon) CH2'-CH4 fragment covering amino acids 226-547. The DNA sequence was isolated from a human myeloma 266-547. The DNA sequence was isolated from a human myeloma cases. CDNA contains of the N-terminus of INT-10 index control of the tryptophan promoter. The resultent protein pwT211 under control of the tryptophan promoter. The resultent protein pwT211 under contains some non-Fc amino acids. These were removed by replacing their coding sequence with a bicistronic linker. The resultant construct encodes the Fc(epsilon) constant heavy region from amino acids 226-547. When it is expressed in E.coli, the protein produced is a non-unmasks new antigenic sites thus rendering the Pattern of glycosylation unmasks new antigenic sites thus rendering the Ffragment immunogenic and able to induce antibodies that recognise native IgE but do not form histamine-releasing complexes. The Fc fragments can be used in anti-allergenic vaccines to modulate the intensity of immune responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            has

Ig gamma-1 chain C region - rat

() Species: Rattus norvegicus (Norway rat)

C) Species: Rattus norvegicus (Norway rat)

C) Species: Rattus norvegicus (Norway rat)

C) Accession: DS0017; C25941

R) Brueggemann, M.

Gare 74, 473-482, 1988

A,Title: Evolution of the rat immunoglobulin gamma heavy-chain gene family.

A,Reference number: PS0017; MUID:89232738; PMID:3149946

A,Reference number: PS0017

A,Molecule type: DNA

A,Residues: 1-326 ABNA

A,Reference number: Residues: Diamond, A.; Howard, J.; Cobbold, S.; Waldmann, H.

Proc. Natl. Acad. Sci. U.S.A. 83, 6075-6079, 1986

A,Title: Immunoglobulin heavy chain locus of the rat: striking homology to mouse antibod

A,Reference number: A25941; MUID:86287397; PMID:3016742

A; Note: this has the e15 allotypic marker, 185-Ala
C; Complex: An immunoglobulin hererotetramer subunit consists of two identical light (kap; hain disulfide bonds. In some cases, such as 1gA and 1gM, the subunits associate into la C; Superfamily: immunoglobulin C region; immunoglobulin hemotogramer; immunoglobulin hemotogy *IM1>
F; 20-82, Domain: immunoglobulin homology *IM2>
F; 236-303, Domain: immunoglobulin homology *IM3>
F; 236-303, Domain: immunoglobulin homology *IM3>
F; 173, Binding site: carbohydrate (Asn) (covalent) #status predicted

C.Comment: Lys-335 is removed posttranslationally.
C.Complex: An immunoglobulin heterotetramer submit consists of two identical light (ka hain disulfide bonds. In some cases, such as 1gA and 1gM, the submits associate into 1 C.Superfamily: immunoglobulin C region; immunoglobulin homology
C.Keywords: alternative splicing; duplication; glycoprotein; heterotetramer; immunoglob F;08-118/Region: hinge
F;142-211/Domain: immunoglobulin homology <IM2>
F;248-315/Domain: immunoglobulin homology <IM3>

A;Title: Interchain disulfide bridges of guinea pig gamma-2- immunoglobulin.

A;Title: Interchain disulfide bonds

A;Title: Interchain disulfide bonds

A;Tontents: annotation; disulfide bonds

A;Contents: annotation; disulfide bonds

A;Note: Cys-16; Is involved in a heavy-light chain bond

A;Note: Cys-16; Cys-107, and Cys-110 form inter-heavy chain bonds

A;Note: Cys-16; Cys-107, and Cys-110 form inter-heavy chain bonds

C;Comment: This chain was isolated from pooled serum of strain 13 inbred guinea pigs.

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap hain disulfide bonds In some cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin cases, such as IgA and IgM, the subunits associate into la C;Superfamily: immunoglobulin homology <IM1>

Name=Membrane-bound;
Name=Membrane-bound;
Isold=P01865-1; Sequence=External;
-!- MISCELLANEOUS: The sequence differs from that of the a allele, from BALB/c mice, at 15% of the positions.
-!- SIMILARITY: Contains 3 immunoglobulin-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     REMBL, J00479; -; NOT_ANNOTATED_CDS.
